16 September 2015

The unique whisky series – experience Swedish oak from Thorslundkagge’s own research project

The importance of oak origin, size of the barrel, time and toasting degrees for whisky.

Thorslundkagge cooperage is a cooperage with high demands on quality, knowledge and service. Our thirst for knowledge and curiosity inspired us to start up a research project about Swedish oak and the importance of oak barrels for maturing beverages. Year 2010 a research project was started together with Örebro University. Raw distillate and fermented wine were bought to be matured in supervised environment. During the maturation process samples were taken continuously and a large database were created.

The same raw spirits were matured the same time in barrels of Swedish, French and American oak. We produced barrels in three different sizes and in three toasting degrees and also charred barrels. The study focused on the development of the 12 most significant compounds in oak over time. It would have been too overwhelming to study all the compound oak contains, which are more than 500 different compounds.

Now we are proud to present You these unique whisky’s and to offer You an outstanding taste experience of Swedish oak.

Welcome to our stand no. 53 in the Hall !!
Meet us 24-26 of September and 1-3 of October at the NackaStrandMässan.

“In whisky veritas!”
